polylinker; Site_1: Not I; Site_2: Eco RI; The
NHL BMAP_MSC library is a non-normalized library
constructed from mouse spinal cord. The tag is a string
of 5 nucleotides present between the Not I site and the
oligo-dr track. The library was constructed as described
by Bonaldo, Lennon and Soares, Genome Research 6: 791-806
/ 1996. Tissue provided by Ms. Annie Novakovich,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oligo-driven control of the state shown in beginning of sequence is likely internal to the message. CDNA Library Preparation: M.B. Soares Lab Clone distribution: NIH BMAP CDNA clones will be made available by the means that is soon to be determined. When NIH record will be updated accordingly when that means is determined. The following repetitive elements were found in this cDNA sequence: Seq primer: M13 Forward

Coligo-dT track not found, Not I site shown in beginning of sequence is likely internal to the message. CDNA Library Preparation: M.B.

Soares Lab Clone distribution: Researchers may obtain BMAP CDNA clones from RESEARCH GENETICS. It should be noted that Bento Soares is generating a small number of additional specialized non-redundant arrays of BMAP CDNAs whose availability will be considered under appropriate and limited collaborative arrangements The following repetitive elements were found in this CDNA sequence: 1-31, > (CAG)n#Simple_repeat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    BE995172 455 bp mRNA linear EST 05-OCT-2000 UI-M-CGOp-bil-h-10-0-UI.sl NIH_BMAP_Ret4_S2 Mus musculus cDNA clone UI-M-CGOp-bil-h-10-0-UI 3', mRNA sequence.

                                                       The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alloviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.

                                                                                                                                                                                      ö
                                                                             The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         720
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               540

                                                                                                                     The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    099

Thomas WJ;

This cDNA clone, designated cDNA24, is derived from human gene whose mutated form is associated with hereditary haemochromatosis (HH). It was obtained from a directionally cloned plasmid-based CDNA library following identification of the HH locus in the HLA region of chromosome 6. A single mutation (24d1) in the HH gene appears responsible for the majority of HH disease. This comprises a G to A substitution that is present in 86% of affected chromosomes and in 4% of unaffected chromosomes. It results in a chromosomes and in 4% of unaffected chromosomes. It results in a critical disulphide bridge important for secondary structure. The critical disulphide bridge important for secondary structure. The critical disulphide bridge important for secondary structure. The Argo6090, the 1437 bp cDNA sequence [1a] and their 24d1, 24d2 and 24d7, variants; a cloning or expression vector; host cells; a peptide product chosen from the HH gene product, its variants (24d1, 24d2 and 24d7), or a peptide of at least 56 amino acid residues of these; an antibody produced using the peptide; a method mutation; an antibodel for the HH disease; metal chelation an annimal medel for the HH disease; metal chelation and annimal medel for the HH disease; metal chelation and annimal medel for the HH disease; metal chelation and annimal medel for the HH disease; metal capents for mitigation of injury due to oxidative process in vivo or mitigation of injury in connection with HH disease. or pairs of oligonuclectides covering a range of nuclectides from (1), (1a) or their variants, useful for detecting a polymorphism in the HH gene. The invention also relates to methods for screening therapeutic agents for activity in connection with HH disease; an antisense oligonucleotide directed against a transcriptional product of a nucleic acid sequence as above; and oligonucleotides for HH homozygotes, to HH diagnosis, prenatal screening and diagnosis, and therapies of HH disease, including gene therapy, protein- and antibody-based therapeutics, and small molecule

The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.

This sequence represents the haemochromatosis (HC) gene. Mutations in this sequence are detected using the method of the invention. The method is for identifying an individual with hereditary haemochromatosis (HH) or a predisposition to develop HH or to genetically pass on HH to an offspring, comprising isolating a biological sample and amplifying a coffspring, comprising isolating a biological sample encompassing all or part of the DNA between markers D65265 and D65276, and detecting at least one homozygous or heterozygous mutation in a nucleotide within the region. The method can also be used for identifying an individual with an autosomal recessive discorder (ARD) or predisposition to develop and/or genetically pass on an ARD to an offspring, comprises isolating a biological sample from the individual and screening genomic DNA in the sample for the presence of a homozygous or heterozygous mutation in a

gene, the normal function of which, is required to prevent progression of the disorder. The method(s) can be used to identify individuals that are monozygous or heterozygous (carriers) for the mutation causing the ARD. Especially the method is used to diagnose HH or predisposition to HH by detecting a Cys2827yr substitution. Individuals homozygous for this mutation have HH and heterozygotes are potential carriers of the

The present sequence encodes a human histocompatibility iron loading (HFE) protein. The HFE gene is a major histocompatibility (MHC) non-classical class I gene located on chromosome 6p. Mutations in the gene lead to iron disorders. The specification describes a method for diagnosing an iron disorder or a genetic susceptibility to develop the disorder in a mammal. The method comprises determining the presence of a mutation in exon 2 or an intron of a HFE gene or protein. The mutation is not a C to G missense mutation at nucleotide 187 of the sequence given in A95769 (Genbank Accession number U60319). The presence of the mutation indicates the disorder or the genetic susceptibility to the disorder. The method is used to diagnose an iron disorder e.g. haemochromatosis, or a genetic susceptibility to develop it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   a mutation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.

                                                                                                                                products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           4421

the allelic association was no longer observed. A single mutation disease. This comprises a G to A substitution that is present in disease. This comprises a G to A substitution that is present in g6% of affected chromosomes and in 4% of unaffected chromosomes. Tr results in a Cys to Tyr substitution in the encoded protein (see AAW36499) at a critical disulphide bridge important for secondary structure. The following are claimed: the HH genomic DNA (1), a 1437 bp cDNA sequence (1a) (see AAP36691) and their Add). 24d2 and 24d7, or a peptide product chosen from the HH gene product, its variants cells; a peptide product chosen from the HH gene product, its variants cells; a peptide product chosen from the HH gene product, its variants cells; an antibody produced using the peptide; a method cestumine the presence or absence of the common HH gene mutation; an annimal model for the HH disease; metal chelation agents, T-cell differentiation factors and therapeutic agents for the mitigation of injury due to oxidative process in vivo or the mitigation of injury due to oxidative process in vivo or the rappeutic agents for activity in connection with HH disease; an antisense oligonucleotide directed against a transcriptional therapeutic agents for activity in connection with HH disease; and therapeutic agents for activity in connection with HH disease; or product of a nucleic acid sequence as above; and oligonucleotide directed against a transcriptional corpustors of product. The invention also relates to methods for screening diagnosis, and therapeutics, and therapeutics, and small molecule therapeutics. This genomic DNA sequence corresponds to the human gene whose mutated form is associated with hereditary hemconfromatosis (HH). To identify this novel gene, allelic association patterns were determined between known markers and the HH locus in the HLA region of Chromosome 6. A physical clone coverage was then generated extending from D65265, which is a marker that is centromeric of HLA-A, in a telomeric direction through D65276, a marker at which the allelic association was no longer observed. A single mutation therapeutics XXCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCXX

These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CACCCTGCAGGTCATCCTGGGCTGTGAAATGCAAGAAGACAACAGTACCGAGGGCTACTG 628

The present sequence represents the human histocompatibility iron loading (HEE) gene. The HFE gene is a major histocompatibility (MHC) non-classical class I gene located on chromosome 6p. Mutations in the gene lead to iron disorders. The specification describes a method for diagnosing an iron disorder or a genetic susceptibility to develop the disorder in a mammal. The method comprises determining the presence of a mutation in exon 2 or an intron of a HFE gene or protein. The mutation is not a C to G missense mutation at nucleotide 187 of the sequence given in A96769 (Genbank Accession number 16019). The presence of the mutation indicates the disorder or the genetic susceptibility to the disorder. The method is used to diagnose an iron disorder.
                                                                                                                                                                                                                                                                                                           Diagnosing an iron disorder e.g. hemochromatosis or a genetic susceptibility to develop it, by determining the presence of a mutation in exon 2 or an intron of a histocompatibility iron loading nucleic acid -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 5011

The present invention describes hereditary haemochromatosis gene products from the human haemochromatosis gene. The present sequence represents a hereditary haemochromatosis upong from an hereditary haemochromatosis with a feeted individual. Also described is a method to determine the presence or absence of the common hereditary haemochromatosis (HFE) gene mutation in an individual comprising:

(a) providing DNA or RNA from the individual; and (b) assessing the DNA or RNA for the presence or absence of the haplotype or genotype indicates the likely presence of the HFE gene mutation in the genome of the individual. The HFE gene sequences from the present invention can be used to develop products for use in the diagnosis and treatment of HFE. The present invention also describes BTF genes, which are homologues of the milk protein butyrophilin (BT), and can be used in the production of agonists

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 42739
and antagonists of BT function. Also described are: (1) a RoRet gene which can be used to develop products for the study, diagnosis and treatment of lupus and Sjogren's syndrome; and (2) NPT3 and NPT4 genes which are homologues of a type I sodium transport gene, and can similarly be used for hypophosphatemia.
                                                                                                                                                                                                                                                                                                                                                                                                                            43039
